

### In the Abstract

*Please replace the Abstract now of record with the following:*

The present invention relates to ~~a~~A process for the secured distribution of digital fixed pictures in the form of streams comprising sequences of data each containing a part of the information of the picture, ~~which process comprises a stage for the modification of~~ comprising: modifying the original stream by modifying at least a part of ~~these~~the data sequences, ~~which modification to~~ produces a stream modified in the same nominal format as the original stream, ~~and which process comprises a stage for the transmission of~~ transmitting the modified stream, and a stage for reconstruction of the modified stream with the aid of a decoder in the ~~addressed~~addressee equipment, ~~characterized in that~~wherein the reconstruction is adaptive and progressive as a function of information coming from a digital profile of the ~~addressed~~an addressee user. ~~This original stream is coded in accordance with a process for coding in wavelets.~~

~~This modification produces a modified main stream and complementary information permitting the reconstruction of the original stream by a decoder, which process comprises a stage for the transmission of the modified stream and also comprises a stage for the transmission to the addressed equipment of a subset of this modification complementary information, which subset is determined as a function of information coming from a digital profile of the addressee.~~
